

Unitatea 5:

EFECTELE DISTRUCTIVE ALE VIRUȘILOR INFORMATICI

Evaluare:

1. Trasați sub aspect teoretic problemele care apar din cauza procesului de infectare cu virus a calculatorului.

2. Traduceți următoarele enunțuri din limba engleză în limba română:

Viruses usually attach themselves to a file or infiltrate a file.

A virus enters a computer only together with an infected file.

Some viruses, after entering a computer, hide, replicate, and then begin to act.

To activate a virus, it is necessary to run the infected file, and only after that does the virus begin to operate on its own.

If no measures are taken to protect against computer viruses, the consequences of infection can be very serious.

Without the user's knowledge, viruses can perform various arbitrary actions, including causing harm to the user or the computer.

A computer virus is a small program written by a highly qualified programmer, capable of self-replication and performing various destructive actions.

Today, more than 50,000 computer viruses are known.
